## CHRYSLER A604 "BUZZING" NOISE WHEN SELECTOR LEVER IS PLACED IN DRIVE OR REVERSE

**COMPLAINT:** When the manual selector lever is placed into either Drive and/or Reverse from the Park and/or Neutral position, a "Buzzing" noise is heard coming from the transaxle area for approximately one to two seconds and then stops.

**CAUSE:** This noise is created by the solenoid assembly which includes four different solenoids.

**CORRECTION:** The "Buzzing" noise described above is **NORMAL**. The **ONLY** thing that can be done to *help alleviate* the "Buzzing" noise, is to ensure that the Solenoid Assembly Sound Cover is present, and installed properly as shown in Figure 1.
